CONTENTS

PART I – Introduction

- Chapter 1** Introducing multiple sclerosis, aims and outline of the thesis
- Chapter 2** Outcome measures in clinical trials for multiple sclerosis

PART II – Clinical assessment of upper extremity function and mobility

- Chapter 3** Measuring various aspects of upper extremity function in multiple sclerosis enhances disability assessment independent from ambulatory impairment
- Chapter 4** Tasks of activities of daily living (ADL) are more valuable than the classical neurological examination to assess upper extremity function and mobility in multiple sclerosis
- Chapter 5** Minimal clinically important difference of improvement on the Arm Function in multiple sclerosis Questionnaire (AMSQ)
- Chapter 6** Responder rates to fampridine differ between clinical subgroups of multiple sclerosis patients and patient reported outcome influences treatment decision making

PART III – Video-assisted assessment of motor functioning

- Chapter 7** Reference videos reduce variability of motor dysfunction assessments in multiple sclerosis
- Chapter 8** Video-assisted rating improves the detection of change in motor function in multiple sclerosis
- Chapter 9** Autoencoder: a new method for keeping data privacy when analysing videos of patients with motor dysfunction – a proof-of-concept study

PART IV – Discussion, summaries and appendices

- Chapter 10** Discussion and future perspectives
- Appendices** Nederlandse samenvatting
- Author affiliations
- List of publications
- Dankwoord
- About the author
